Subject Measurement of VOC values - KEIM Ecosil_ME white

The VOC levels of the various KEIM products are based on calculations made in accordance with the criteria postulated by

- Greenstar, AELA 23-2005
- APAS D181
- EU-Decopaint Directive 2004/42/EG

These criteria foresee either the calculation based on the raw materials used and/or tests of the products containing these raw materials. We have done both for the major products in order to verify the data received for the raw materials.

The VOC content of the paints is very low and oscillates around the lower limit value of the determination methods prescribed by the regulations, DIN EN ISO 11890-2 (gas chromatography) and ASTM D 3960.

We can further confirm that no solvents or VOC are used in the production process but are only imported in very low quantities by the raw materials used.

VOC value of KEIM Ecosil-ME1 white: < 1 g/l
